

Health Data Summary

From April 11, 2025, to July 11, 2025, the caregiver maintained a fairly consistent routine for the patient. The patient's heart rate remained within a normal range, with an average rate of 41.5 beats per minute and a median rate of 39 beats per minute. These values did not vary significantly throughout this period, indicating stable cardiovascular health.

The patient had a good amount of sleep, averaging 9.2 hours per day. This included 5.6 hours of light sleep, 1.9 hours of deep sleep, and 1.6 hours of REM sleep. They were awake for an average of 0.7 hours during their sleep cycle. This suggests the patient was getting a healthy amount of rest.

The patient regularly took a medication called "Med2 - 15mg" and had meals that often included water with cranberry juice and a turkey sandwich with potato chips. This indicates a consistent medication and dietary regimen.

However, there were some concerns noted by the caregiver. They observed moisture around the patient's g-tube area, which led to the replacement of the g-tube button on June 27, 2025. They also noticed discharge from the g-tube visible on the patient's T-shirt when they woke up from sleep. While these issues were addressed, they suggest potential complications with the g-tube that should be monitored.

The caregiver also reported that the patient had a "great day" on June
